Molecular Diagnostics in Cancer Testing

Description: Molecular diagnostics is a rapidly-advancing area of research and medicine, with new technologies and applications being continually added. The technologies that come under the umbrella of molecular diagnostics include first-generation amplification, DNA probes, fluorescent in-situ hybridization (FISH), second-generation biochips and microfluidics, next-generation signal detection, biosensors and molecular labels, and gene expression profiling using microarrays. These technologies are improving the discovery of therapeutic molecules for cancer, the screening, diagnosis and classification of cancer patients, and the optimization of drug therapy.

This report describes the specific segment of the in vitro diagnostics (IVD) market known as molecular diagnostics (MD), with a specialization in the MD tests for cancer. In the current medical diagnostics market, molecular diagnostics for cancer testing offers one of the brightest areas for growth and innovation. The confluence of breakthroughs in genomics, proteomics, and the development of microarray devices to measure analytes in the blood and various body tissues, has led to this revolutionary market segment offering the power of advanced analytical techniques to the diagnosis and treatment of cancer.

This report analyzes the size and growth of the molecular diagnostics market in its applications for cancer detection and therapy, examining the factors that influence the various market segments and the dollar volume of sales, both in the United States and worldwide.
