PHOTOSYNTHESIS -. Edition No. 1

Description: An analysis of the consequences arising from the non-linearity of the photosynthetic light curves on the values of quantum requirement, as well as on the action spectra and quantum efficiency spectra in dependence of the suspension optical densities is presented. A kinetic model of the oxygen production reaction is elaborated in which in addition to the non-cooperative (Kok's) mechanisms a cooperative one is also included. According to this model the oxygen precursors obtained in different oxygen evolving reaction centres could migrate in the surrounding media and recombine. The two widely accepted fundamental concepts, i.e. the concept of the photosynthetic units and the concept of the two photosystems - the Z-scheme, are reconsidered, and completely new ideas are presented. A logical explanation of almost all unexplained up to now important observations – Emerson's first effect, the red drop effect and Emerson's enhancement effect, the effect of Blinks', the inhibitory action of oxygen on photosynthesis - Warburg's first effect and the effect of CO2 on the photochemical (Hill reaction) activity of isolated chloroplasts is presented.

Payment Information

Please indicate the payment method you would like to use by selecting the appropriate box.

☐ Pay by credit card: You will receive an email with a link to a secure webpage to enter your credit card details.

☐ Pay by check: Please post the check, accompanied by this form, to:

Research and Markets,
Guinness Center,
Taylors Lane,
Dublin 8,
Ireland.

☐ Pay by wire transfer: Please transfer funds to:

- Account number: 833 130 83
- Sort code: 98-53-30
- Swift code: ULSBIE2D
- IBAN number: IE78ULSB98533083313083
- Bank Address: Ulster Bank,
27-35 Main Street,
Blackrock,
Co. Dublin,
Ireland.
