Optimal Design of Solar Fields. Edition No. 1

Description: The design of solar collector systems requires the use of solar radiation data, solar equipment and cost, energy backups, installation and maintenance cost, etc. An important parameter in a solar field design is shading between collector rows. This book deals with the analysis of shading by a collector row on the adjacent row, the formulation of the optimization problem and the optimal design of thermal and photovoltaic solar fields. The book deal with several problems, such as: Obtaining maximum annual incident energy on the collector planes from a given field size or Finding the required minimum field area for a given incident energy. The last part of this book deals with the optimal design of single axis tracking collector fields.
