IMMUNIZATION OF BUFFALO AGAINST BOOPHILUS MICROPLUS. Edition No. 1

Description: Ticks and tick borne diseases cause many problems to man and domestic animals worldwide. These problems are most closely associated with domestic animals especially cattle, buffalo and sheep in tropical and subtropical regions of the world. It remains true that the major problems associated with ticks are their effect on domestic animals and the most important tick in this context is the cattle tick Boophilus (B.) microplus. Therefore, B. microplus, has been the object of considerable interest throughout the world. The primary objective of these investigations was to develop an effective vaccine against B. microplus. For this purpose, it was deemed necessary to establish optimum conditions for the laboratory rearing of ticks, in vitro propagation of midgut cells; and determination of immunogenic and protective effects of whole ticks, midgut, midgut cell culture, protein and lipopolysaccharides subunit vaccines against B. microplus. The results of the current study confirm the role of carbohydrates as protective antigen or as a factor for specificity of these antigen.

Order by Fax - using the form below

Order by Post - print the order form below and send to

Research and Markets,  
Guinness Centre,  
Taylors Lane,  
Dublin 8,  
Ireland.
