Genetics in Sustainable Fisheries Management

Description: Recent years have witnessed a surge of interest in the application of the principles of genetics to conservation and the sustainable management of fish resources. The realisation of the genetic basis of many fisheries management problems is growing at a time when the world catch from fisheries is approaching the maximum sustainable level and all levels of biodiversity are threatened. Contributions from an international authorship are based on the latest scientific information on tropical and temperate ecosystems and their fish resources, and provide a detailed account of the genetic profiles of different fish populations, molecular genetic marking techniques, factors affecting genetic diversity, and genetic manipulation techniques.

Genetics in Sustainable Fisheries Management sets out to apply both conservation and biotechnology techniques to protect natural fish gene pools, while addressing the issues concerning biosafety and sustainable management.

Contents:

Contributors;
Preface;
Introduction;
Biological units in fishery management;
Marine genetic resources and sustainable fisheries;
Framework for conservation and management of genetic resources of marine fish;
Freshwater fish genetic resources and conservation approaches;
Genome manipulation in fishery management;
Gene transfer in fisheries;
Genetic factors in production;
Introgressive hybridization of introduced peled with the native whitefish;
Microsatellite DNA markers for monitoring genetic change in hatchery stock for release and net-cage culture of red sea bream;
