Global Lung Cancer Therapeutics Market 2015-2019

Description: About Lung Cancer

Cancer occurs when, after undergoing cell transformation, normal cells grow and multiply without control. Lung cancer is a common cause of mortality and morbidity in both developed and developing countries. Non-small cell lung cancer is the commonest type of lung cancer and forms almost 85-90 percent of the total cases diagnosed. It grows and spreads slowly. Smoking is considered as a major cause of lung cancer, though lung cancer also occurs in non-smokers. Non-small cell lung cancer is of three types: squamous cell (epidermoid) carcinoma, adenocarcinoma, and large cell (undifferentiated) carcinoma. Small cell lung cancers form roughly 10-15 percent of all the diagnosed cases of lung cancer. There are two types of small cell lung cancer: small cell carcinoma and combined small cell carcinoma. It can be classified into two stages: limited-stage small cell lung cancer and extensive-stage small cell lung cancer. Small cell lung cancer cannot be cured using current therapies available in the market. Some of the common symptoms associated with lung cancer are chest pain, persistent cough, blood in sputum, fatigue, loss of appetite, weight loss, shortness of breath, and wheezing. Both small cell lung cancer and non-small cell lung cancer are recurrent in nature, which are difficult to cure.

The analysts forecast the Global Lung Cancer Therapeutics market to grow at a CAGR of 3.83 percent over the period 2014-2019.
