Description: Formulation science plays an important role in colloid and physical chemistry, but also in analytical chemistry and chemical engineering. For the design of such everyday products as detergents, cosmetics, paints, pharmaceuticals, food and others, different formulation techniques are needed.

Written by one of the most experienced authors and leading scientists in the field worldwide, this is the first truly comprehensive coverage of this exciting topic. Starting with a general introduction, this one-stop reference presents the science and technology behind the formulation of disperse systems, such as emulsions, suspensions, and foams, while also including many practical examples.

With its unified concept, this book is indispensable for chemists in industry, chemical engineers, the pharmaceutical industry, polymer, surface and physical chemists, as well as food technologists, materials scientists and those working in the paints and coatings industry.
