Description:
A chelating agent is a chemical substance that can form covalent bonds with metal ions, thereby forming a metal-ion complex. It reduces the negative effect that some metal-ions have on chemical processes, formulations, and the environment by chelating with them. Chelating agents are broadly classified into aminopolycarboxylic acid (APCA), sodium gluconate, organophosphates, and others. They are used in a wide range of industries including Pulp and Paper and Water Treatment Chemicals.

The analysts forecast the Global Chelating Agents market to grow at a CAGR of 3.07 percent over the period 2013-2018.
