Global Meningococcal Vaccines Market 2014-2018

Description: About Meningococcal Vaccines

Meningitis is characterized by the inflammation of the protective lining (meninges) present around the brain and the spinal cord. On the basis of its underlying cause, meningitis can be classified into infectious and non-infectious meningitis. In terms of the type of organism, infectious meningitis can be sub-divided into bacterial meningitis, viral meningitis, fungal meningitis, and parasitic meningitis. Bacterial meningitis is the life-threatening form of infectious meningitis, which can occur due to infection by different bacterial species such as Hemophilus influenza, Listeria monocytogenes, Neisseria meningitidis, and Streptococcus pneumonia. Bacterial infection can spread to the blood stream, leading to septicemia. An infection by Neisseria meningitidis can lead to meningococcal disease, which is associated with the simultaneous occurrence of meningitis and septicemia.

Meningococcal disease can occur at any age; however, it is more prevalent in infants and adolescents. Meningococcal disease involves a sudden onset of symptoms which can lead to death within hours, if left untreated. Disease survivors can recover fully or may suffer from long-term after effects such as neurological defects. Meningococcal disease is generally treated with antibiotics. Preventive measures involve the administration of meningococcal vaccines.

The analysts forecast the Global Meningococcal Vaccines market to grow at a CAGR of 15.00 percent over the period 2013-2018.
