Global Hepatitis B Vaccines Market 2014-2018

Description: About Hepatitis B Vaccines

Hepatitis B is an inflammatory condition that occurs due to infection by hepatitis B virus. Hepatitis B virus is an enveloped virus that belongs to the family of hepadnavirus. It contains a circular genome with partially double-stranded DNA. The virus interferes with the normal functioning of the liver cells. Following the viral infection, the immune system is activated against virus and hepatocytes infected with viruses. This, in turn, leads to the inflammation of the liver. Extra-hepatic manifestations of hepatitis B include polyarteritis nodosa, Gianotti-Crosti syndrome, transient serum sickness-like syndrome, and membranous glomerulonephritis. Perinatal transmission of hepatitis B virus is the most common mode of infection spread. Age of a person at the time of infection and infecting dose of virus are important factors that determine the severity of acute or chronic hepatitis B. Most of the patients suffering from acute hepatitis B recover spontaneously without significant consequences. The chronic form of infection, in some cases, can progress up to cirrhosis and liver cancer. Hepatitis B infection can be prevented by immunization with hepatitis B vaccines.

The analysts forecast the Global Hepatitis B Vaccines market to grow at a CAGR of 4.00 percent over the period 2013-2018.
