Global Fracking Chemicals and Fluid Market 2014-2018

Description: About Fracking Chemicals and Fluid

Fracking chemicals and fluids are used in the fracturing technique commonly known as hydraulic fracturing. Hydraulic fracturing or fracking is a technique of well stimulation, in which a fluid at high pressure (typically water mixed with sand and chemicals) is injected into a well to create minor fractures in the deep rock foundations to allow natural gas, petroleum, and brine to move upwards in the well from the deep reserves. Fracking is commonly used for shale gas and oil recovery. Such stimulation is usually carried out once during the productive life of a well and helps eliminate fluids (gas and oil), thus increasing the productivity of the well. Hydraulic fracturing is used when the field production of a well has declined. The composition of fracking chemicals and fluid varies depending on the type of fracturing used, the conditions of the specific welfare fractured, and the characteristics of water in the field. A typical fracture treatment uses between 3 to 12 chemicals additives.

The analysts forecast the Global Fracking Chemicals and Fluid market to grow at a CAGR of 9.0 percent over the period 2013-2018.
