Global Animal Vaccines Market 2014-2018

Description: About Animal Vaccines

Animal vaccines are biological preparations used to improve the immunity of animals. Animal vaccines are generally prepared from weakened or dead microbes that can cause a particular disease when in their healthy state. Some of the animal vaccines are also formulated using a part of a microbe's body such as protein subunits or toxic components. These components act as stimulating agents that trigger the immune system in an animal body. This then prepares the necessary antibodies to act against the microbes present in the body or to destroy any that it encounters in the future. Based on their applications, animal vaccines are predominantly categorized into livestock vaccines, companion vaccines, and aquaculture vaccines.

The analysts forecast the Global Animal Vaccines market to grow at a CAGR of 8.25 percent over the period 2013-2018.
