Global Epilepsy Market 2014-2018

Description: About Epilepsy

Epilepsy is defined as a spectrum of brain disorders varying from benign symptoms to severe, disabling, and life-threatening symptoms. It can be caused by various factors ranging from brain malformations and tumors to meningitis, high-risk pregnancies, and birth trauma. However, when the underlying cause of the disease is unidentified, as occurs in majority of the cases, it is known as idiopathic epilepsy. Epilepsy is characterized by repeated occurrence of generalized or focal seizures. Seizures result from an imbalance between the inhibitory and excitatory signals of the brain leading to sudden-onset of excitation. The occurrence of two or more unprovoked seizures is an important criteria to diagnose a person with seizures as being epileptic.

The analysts forecast the Global Epilepsy market to grow at a CAGR of 5.06 percent over the period 2013-2018.
