Global Multiple Myeloma Drugs Market 2015-2019

Description:

About Multiple Myeloma

Multiple myeloma is a common cancer that affects the plasma cells, a type of white blood cell. It begins in the plasma cells of bone marrow. The primary function of the plasma cells is to combat infections by producing antibodies, which attack germs after recognizing them. In multiple myeloma these plasma cells become malignant, it causes the production of a defective protein, which grows uncontrollably. This protein moves into the bones and cause tumors. Myeloma occurs when the malignant cells form a tumor. According to the Multiple Myeloma Research Foundation, the disease has been classified into six distinct stages: Pain in bone, vulnerability to infections, increased restlessness, kidney and urination ailments, fatigue, increase in thirst, loss of appetite and loss in weight. The disease can be diagnosed by a series of tests. The initial evaluation consists of a blood test, urine test and a bone marrow biopsy. X-ray, MRI scan, CT- scan and PET scan are other tests to diagnose multiple myeloma. Genomic testing is also carried out to confirm the presence of multiple myeloma in the suspected patients.

The analysts forecast the Global Multiple Myeloma Drugs market to grow at a CAGR of 8.50 percent over the period 2014-2019.
