
Description:

An EGR system helps recirculate gases from the exhaust system in an automotive engine. The EGR system valve opens when it encounters pressure from a vehicle's exhaust and sends back the exhaust gas into the combustion chamber. The primary function of an EGR system is to reduce the combustion temperature of the fuel in an automotive engine, and thus reduce production of NOx during engine operation. In gasoline engines, the EGR system also reduces fuel consumption by de-throttling the engine at partial load. At present, the adoption of EGR systems has increased because of stringent government regulations regarding the emission of harmful gases, such as NOx, and PM.
