Global Silver and Gold-based Brazing Materials Market 2015-2019

Description:
About Silver and Gold-based Brazing Materials
Brazing is defined as the process of joining two metals by deploying a filler metal such as a brazing alloy. In the brazing process, the filler metal is heated slightly above its melting point and allowed to flow through capillary action in between the two base metals that require to be joined. This process is normally undertaken by using a controlled atmosphere called the flux. The flux is used to prevent, dissolve, or remove oxides that are formed during the brazing process. Brazing is similar to soldering, except that the melting point of the filler metal used in brazing is above 450 degrees centigrade, while the melting point of that used in soldering is below 450 degrees centigrade. There are several types of brazing materials in the market. Silver-based and gold-based brazing materials are two major types.

The analysts forecast the Global Silver and Gold-based Brazing Materials market to grow at a CAGR of 3.01 percent over the period 2014-2019.
