Global Preventable Vaccines Market 2015-2019

Description:
Vaccines can be defined as a product that stimulates a person’s immune system to produce immunity to a specific disease, thereby protecting the person from that disease. According to the CDC, vaccines are usually administered through needle injections, but can also be administered orally or sprayed into the nose. Vaccines can be used for both adults and infants and adolescents. Pediatric vaccines are used for the immunization of children to give protection against various infectious diseases such as diphtheria, influenza, hepatitis, pneumococcal diseases, and meningococcal diseases. According to the classification adopted by the US FDA, children are classified as newborn, infant, and adolescent, ranging from birth to 21 years of age. However, the EMA classifies pediatrics as ranging from birth to 18 years of age.

The analysts forecast the Global Preventable Vaccines market to grow at a CAGR of 10.16 percent over the period 2014-2019.

Covered in this Report
This report covers the present scenario and the growth prospects of the Global Preventable Vaccines market for the period 2015-2019. To calculate the market size, the report considers revenue generated from the sales of preventable vaccines. The report examines the market for vaccines used in humans. It covers only commercialized vaccines for diseases that are vaccine preventable.

The report does not cover emerging vaccines for diseases that are not currently vaccine preventable, such as Ebola infection, Epstein-Ban virus infection, Alzheimer’s disease, diabetes, Helicobacter pylori infection, multiple sclerosis, Parkinson’s disease, or West Nile virus infection.

The report has broadly categorized preventable vaccines into two major segments:
- Adult Preventable Vaccines
- Pediatric Preventable Vaccines
