Global Urinary Catheters Market 2015-2019

Description:  About Urinary Catheters

Urinary catheters are devices used to drain out urine, this is called catheterization. These are used in patients who have medical conditions such as urinary incontinence and retention, multiple sclerosis, spina-bifida, dementia, and temporarily post-surgery of prostate or genitals. They are made up of latex, polyurethane, or silicone. A Foley catheter comprises a balloon that holds the catheter tube in the bladder for long-term catheterization, whereas an intermittent catheter is for short-term self-catheterization. Both these urinary catheters are inserted into the urethra, guided through the bladder; however, with advanced catheters such as male external catheters, there is no need to insert catheters into the urethra reducing the rate of CAUTI.

The analysts forecast the Global Urinary Catheters market to grow at a CAGR of 5.23 percent over the period 2015-2019.
