Stent Grafts Market in China 2015-2019

Description:

About Stent graft

A stent graft is a tubular device made up of special fabric, which is reinforced by a rigid structure known as a stent. Most of the stents (mainly composed of metal) are used generally for vascular interventions. The device is used primarily in endovascular surgery for patients that suffer from AAA and TAA. The technique used to treat AAA using stent grafts is known as EVAR. In this technique, stent grafts are used to support weak areas in the arteries known as an aneurysm. The stent is designed so that it can be positioned inside the abdominal aorta, without surgically opening the blood vessel or eliminating any tissue. Moreover, stent grafts can be placed within grafts and fistulas during dialysis. A stent graft can be used in either condition to form an open lumen and check blood from flowing around it.

The analysts forecast the stent grafts market in China to grow at a CAGR of 10.55 percent over the period 2014-2019.
