Global OLED Display Market 2015-2019

Description: About OLED Display

OLEDs are diodes that use organic materials to produce light. The organic material is packed between conductors that are lit up when electricity is passed through them. OLED display units contain many thin films of several types of organic molecules that produce various colors of light. Unlike LCDs, OLEDs do not require backlights and filters because the light emitted is bright enough for display. OLED display units include multiple layers of organic films depending upon the device's requirements.

The analysts forecast the Global OLED Display market to grow at a CAGR of 18.7 percent over the period 2014-2019.
