Peripheral IV Catheter Market in the US 2015-2019

Description: About Peripheral IV Catheters

Peripheral IV catheters are peripheral venous devices used to infuse medication or fluids directly into a vein, or draw blood samples for testing. These catheters are made of a non-irritant material, such as silicone, which negates any side effects caused when they are left in a patient's arm for several weeks or months. Peripheral IV catheters are introduced into the peripheral vein using a needle and fixed to the patient's skin with an adhesive tape. The needle is then removed, leaving a small tube of the cannula at the insertion site. Advanced peripheral IV catheters are equipped with additional safety features to prevent needlestick injuries, which allow for their use in critical care units in hospitals.

The analysts forecast the peripheral IV catheter market in the US to grow at a CAGR of 5.79% over the period 2014-2019.

Covered in this Report

This report covers the present scenario and the growth prospects of the peripheral IV catheter market in the US for the period 2015-2019. To calculate the market size, the report considers revenue generated from the following segments:

Short Peripheral Intravenous Catheter
They are short catheters inserted into the peripheral vein on the hand or arm for administration of medications, fluids, and to draw blood sample.

Integrated/Closed Catheter
These catheters are the most advanced and render high performance. They offer a closed system blood control and high safety benefits to patients.
