About PTSD

PTSD is a psychological condition that develops after a person is exposed to any traumatic event, and it drains a person emotionally. According to the DSM-IV codes found in the Diagnostic and Statistical Manual of Mental Disorders, published by the American Psychiatric Association (APA), PTSD is classified under anxiety disorders. PTSD can occur in individuals of any age, irrespective of the gender; its symptoms can develop immediately after a traumatic event or during the course of time. Its symptoms normally include re-experience of the traumatic event, avoidance of the incidents, and abnormal mood swings. Treatments for PTSD include psychological counselling, which help in identifying the cause of the condition and providing counselling to come out of the situation. Medications present in the market help in reducing the symptoms during the course of the treatment.

The analysts forecast the global PTSD therapeutics market to grow at a CAGR of 1.09% over the period 2014-2019.
