Li-Ion Battery Market for Digital Cameras in Japan and APAC 2015-2019

Description:
Nowadays, most digital cameras run on Li-ion batteries. This is due to their compatibility and ability to last long. The power in these batteries is generated when ions move from a negatively charged anode to a positively charged cathode. During discharge, ions move from the anode to the cathode, releasing energy; while during charging, ions return to the anode. The charge holding capacity of a Li-ion battery deteriorates over time because of ions being trapped in the anode, which necessitates replacement of the battery.

The analysts forecast the Li-ion battery market for digital cameras in Japan and APAC to decline at a CAGR of (2.68%) over the period 2014-2019.
