Global Forming Fluids Market 2015-2019

Description:
About Forming Fluids
Forming fluids are a type of metal working fluids used in operations pertaining to the changing of shape and contour of metals. Forming fluids include rolling oils, drawing and stamping compounds, forging compounds, die-casting compounds, and hydroforming fluids. These liquids offer superior lubrication and corrosion protection and thus help prevent scratches or damage to the substrates during molding and fabrication. Also, most of the forming fluids protect substrates from humidity or acidic conditions that are often encountered in industrial environments. These fluids are formulated using a range of additives that enhance the performance of the composition.

Maintenance expenditure often constitutes a significant portion of various manufacturing and processing industries and the demand for innovative protection solutions in these industry segments often contributes to the demand for metal working fluids and forming fluids in particular.

The analysts forecast the global forming fluids market to grow at a CAGR of 2.84% during 2014-2019.
