Global Stem Cell Umbilical Cord Blood Market 2015-2019

Description: About Stem Cell UCB
UCB is the blood that remains in the placenta and the attached umbilical cord after childbirth. UCB contains stem cells that are unique, smart, and are capable of treating several life-threatening diseases. They are used in the treatment of hematopoietic and genetic disorders. The placental blood can produce 10 times more quantity of stem cells compared to the umbilical cord, which can in turn be used for the treatment of an adult patient. The cord blood that is collected during the childbirth is stored and cryopreserved. The storage of the cord blood can be done at private cord blood banks or public cord blood banks. This preserved blood can be used for the transplantation, and treatment of diseases at the later stages of life.

The analysts forecast the global stem cell UCB market to grow at a CAGR of 30.36% over the period 2014-2019.
