Global Bone Grafts and Substitutes 2015-2019

Description: About bone graft and substitutes
Bone grafting is a surgical procedure that involves replacement of missing bone with bone from another part of the patient's body, or an artificial or natural substitute. Bone grafting is feasible because bony tissue has the ability to regrow. As natural bone grows, it replaces the graft completely, resulting in a completely integrated region of new bone. It is seen in prosthodontic procedures, such as dental implants and denture fabrication, where minimal amount of bone needs to be replaced.

The report forecasts the global bone graft and substitute market to grow at a CAGR of 4.31% over the period 2014-2019.

Covered in this report
Based on type, the global bone graft and substitute market can be segmented into BMP, machine bone allograft, DBM, standard allograft, and others. BMP is beneficial in spinal fusion, joint reconstruction, bone fractures, and bone defects. It also eliminates the need for transplantation of bone from other areas of the body, such as the pelvis. Machine bone allograft uses innovative technology to reshape or mold donor grafts.
