
Description:

About blood screening
Blood screening is a medical process where blood is scanned for testing of particular condition or disease. This procedure is commonly performed for HIV, pregnancy, cancer, and other screening. It provides vital information to the physician regarding the functioning of organs such as kidney, liver, and thyroid. The major blood tests that are extensively used for diagnosing diseases include erythrocyte sedimentation rate (ESR), full blood count (FBC), electrolyte test, karyotyping, enzyme-linked immunosorbent assay (ELISA), C-reactive protein, liver function test, and blood cholesterol test. The market for blood screening has witnessed numerous technological advances such as shift toward the first-generation ELISA to highly advanced NAAT testing, since its inception.

The report forecasts the global blood screening market to grow at a CAGR of 9.31% over the period 2014-2019.
