Global Hospital Infection Therapeutics Market 2015-2019

Description:
Hospital-acquired diseases are also known as nosocomial infections that are acquired in hospitals and other healthcare facilities. These infections are classified only when a patient is admitted for reasons other than the infections and are caused by bacteria, fungi, parasites, or viruses. Most common types of hospital-acquired infections are SSIs, UTIs, bloodstream infections, pneumococcal infections, MRSA, and gastrointestinal illnesses. These infections appear between 48 hours and four days after a patient is admitted and are usually related to a treatment of procedure used to treat or diagnose the patient's initial illness or injury. Hospital-acquired diseases are preventable through adherence to strict guidelines and less usage of invasive equipment that must be followed by healthcare professionals while caring for the patient. Anti-infective drugs are used for the treatment of these infections. These infections can be minimized by following proper infection control measures in the hospitals and healthcare institutions.

The report forecasts the global hospital infection therapeutics market to grow at a CAGR of 3.24% over the period 2014-2019.
