Global Brain Monitoring Devices Market 2015-2019

Description: About brain monitoring devices

Brain monitoring devices are invasive or non-invasive instruments that help in treatment by recording abnormal brain activities. These devices are also used to check the depth of anaesthesia to analyze the alveolar gas concentration values. The devices reduce the intraoperative drug consumption and incidences of post-operative nausea and vomiting in patients who are under anaesthesia. Brain monitoring devices are also used for patients who are suffering from brain disorders such as epilepsy or traumatic brain injury, and stroke. Some of the brain monitoring devices are EEG, MEG, ICP, TCD, and cerebral oximeters. EEG and MEG help for brain imaging and monitoring. aEEG is used for routine neurological care in the neonatal unit. ICP, TCD, and cerebral oximeters are used to measure cerebral perfusion pressure, cerebral blood flow, and to know the oxygenation values.

Manufacturers are introducing new technology to enhance the product lines. For example, Covidien has used BIS level of consciousness technology to measure the effect of anaesthesia in the brain.

The report forecasts the global brain monitoring devices market to grow at a CAGR of 8.68% over the period 2014-2019.
