Global Allergic Rhinitis Drugs Market 2016-2020

Description: About Allergic Rhinitis Drugs

Allergic rhinitis is caused by the interaction of airborne allergens with specific immunoglobulin E (IgE) type antibodies on the surface of mast cells. This interaction causes mast cells to release and synthesize chemicals, causing inflammation of the surrounding tissues. Typical symptoms include rhinorrhea, nasal itching, sneezing, and nasal congestion. Extranasal symptoms such as allergic conjunctivitis, itchy ears and palate, and asthma may also occur. Allergic rhinitis is treated using medications such as antihistamines, intranasal corticosteroids, or immunotherapies. Alternative forms of treatment are also employed in certain cases.

The analysts forecast the global allergic rhinitis market to grow at a CAGR of 0.95% during the period 2016-2020.
