About the Anti-Coagulant Drugs Market
Anticoagulants have been used for over 80 years to treat clotting disorders. It is used as a first line of defense for disorders such as deep vein thrombosis (DVT), pulmonary embolism, AF, and acute coronary syndrome. With the advent of time, traditional therapies are replaced by novel oral anticoagulants, which have better safety and efficacy profiles.

The 1990s saw rapid development in the field of direct thrombin inhibitors. Though these drugs, such as hirudin, have been in use from the early 19th century, they were accepted with the development of genetic engineering technology. The recombinant forms, such as desirudin, are also available in the market. During the same period, the focus shifted toward the development of factor Xa inhibitors, and by early 2000s, the first indirect factor Xa inhibitor, fondaparinux, was released into the market. These drugs were administered by parenteral route.

The analysts forecast the anti-coagulants market in the US to grow at a CAGR of 6.67% during the period 2016-2020.
