Copper Oxychloride is found in industrial compounds, metal corrosions and minerals. It is a green colored solid which is crystalline in nature. Initially, it was produced as a substance that was utilized as a chemical intermediate or as a fungicide.

Copper Oxychloride is also found in natural minerals that includes botallackite, paratacamite, atacamite and clinoatacamite. It is insoluble in water and has pH ranging between 6 and 7. It has atomic mass of approximately about 232.11g/mol. Scientifically, Copper Oxychloride can be produced by performing reaction of hydrolysis between Copper chloride solution at a pH varying between 4 and 7. In this chemical reaction, different bases are utilized. These bases are calcium carbonate, ammonium and sodium carbonate among others.

However, different adverse effects or side effects of Copper Oxychloride are predicted to hinder the growth & expansion of worldwide Copper Oxychloride market. The side effects or an adverse effect of Copper Oxychloride includes eye irritation & inflammation and infection of respiratory tract. On eating, the indications include nausea, vomit and duodenum pain. In serious cases, there can be spurt of blood in vomit or black stools. This can also create jaundice along with inflanted liver. The cells of blood may split leading to circulatory alarm and end.
