Global Surgical Aspiration & Irrigation Suction Pumps Market Assessment & Forecast: 2016 - 2020

Description:
Surgical suction pumps are used to extract tissue, fluids and gases during and even after surgeries. Biological debris remaining after a surgery can lead to life threatening medical complications such as sepsis and strokes in patients. In minimally invasive surgeries, suction helps clear out gases and smoke coming from ablation and resection to give a clear view to surgeons performing medical procedures. This report provides analysis for two broad categories of suction pumps used in surgeries. Suction-aspiration pumps that are used for open surgeries and suction-irrigation pumps used primarily for MIS procedures. Since both have unique surgical application areas, the report also quantifies several applications such as liposuction, laparoscopy, general surgery, urology, OBGYN, thoracic/pleural drainage and others based on the pumps used most prominently. Another key factor differentiating both pumps is that suction-aspiration pumps are purchased independently whereas suction-irrigation pumps are available with laparoscopic or arthroscopic equipment.

Today over 20 million laparoscopic surgeries and 8 million arthroscopic surgeries are estimated to be performed across the world each year. This number has been increasing with a double digit rate each year with aging population and increasing incidence of diseases requiring minimally invasive intervention. Increasing demand for arthroscopic surgeries has also increased demand for these pumps that are purchased as part of entire set along with other MIS equipment.
