About Prostate Cancer Drugs

Prostate cancer is the cancer of prostate gland. According to CDC, it is one of the leading cause of cancer death in men across the races in the US. According to the Urology Care Foundation, globally, one in seven men will be diagnosed with the disease. About one in 35 men die due to prostate cancer. Growth in the prostate can be benign or malignant. Prostate cancer cells spread by breaking away from a prostate tumor. They may travel through blood vessels or lymph vessels and reach other parts of the body. The cells that spread might bind to other tissues, form new tumors, and sometimes damage those tissues as well. When prostate cancer cells spread from their original place to another, the new tumor formed also has the same kind of abnormal cells.

The analysts forecast the global prostate cancer drugs market to grow at a CAGR of 9.21% during the period 2016-2020.
