Global Interventional Cardiology Market 2017-2021

Description: About Interventional Cardiology

Interventional cardiology devices are primarily related to heart disease, and most of the heart diseases have some serious medical conditions, such as angina, congestive heart failure, and arrhythmias. These are often caused by partially blocked coronary arteries, which is the most common cause of death globally.

Since the 1980s, balloon angioplasty has been the standard method for treating coronary artery disease. Coronary artery disease (CAD) blocks the artery that supplies blood to the heart. It occurs when the coronary artery is narrowed or blocked with the formation of plaque, which forms due to reasons such as cholesterol, fatty deposits, calcium, and other substances.

The analysts forecast the global interventional cardiology market to grow at a CAGR of 7.15% during the period 2017-2021.
