Content Delivery Network Market - Forecasts from 2016 to 2021

Description:
The content delivery network is a distribution network that is connected to a large number of servers deployed in multiple geographical areas in order to deliver static or streaming content to end users with enhanced performance. The network chooses the fastest routing alternative to provide the content to users from the node which is in very close propinquity to them.

The advantages of a content delivery network are improved scalability and reduced network congestion over complexities of the traditional approach such as slow retrieval of data along with limited bandwidth. Increased usage of internet services among global users along with growing utilization of mobile technology and social media are some of the factors driving the market. Deployment procedures of this network are very complex as well as expensive, leading to its limited deployment and thereby restraining the market growth.

Global content delivery network market is projected to grow from US$5.396 billion in 2016 to US$18.815 billion in 2021, at a CAGR of 28.38% over the forecast period. The growth of e-commerce market in India and presence of world's largest online population in China is positively impacting the market growth.
