Global Implantable Ports Market 2017-2021

Description: About Implantable Ports

Implantable ports are thin, soft plastic tubes with a rubber disc at the end. Implantable ports are also called as subcutaneous ports or portacaths. They are most commonly inserted in patients undergoing chemotherapy. These ports are used to administer drugs to individuals. The diameter of the port ranges from 2.5 cm to 4 cm. Based on the product type, implantable ports can be classified into two types: single-lumen and double-lumen ports. During the forecast period, the single-lumen implantable ports segment will continue to grow significantly as these ports are used in the majority of insertion procedures, whereas the double-lumen implantable ports segment is expected to grow at a high rate.

The analysts forecast the global implantable ports market to grow at a CAGR of 3.51% during the period 2017-2021.
