Global Preventable Vaccines Market 2015-2019

Description:

About Preventable Vaccines
Vaccines can be defined as a product that stimulates a person’s immune system to produce immunity to a specific disease, thereby protecting the person from that disease. According to the CDC, vaccines are usually administered through needle injections, but can also be administered orally or sprayed into the nose. Vaccines can be used for both adults and infants and adolescents. Pediatric vaccines are used for the immunization of children to give protection against various infectious diseases such as diphtheria, influenza, hepatitis, pneumococcal diseases, and meningococcal diseases. According to the classification adopted by the US FDA, children are classified as newborn, infant, and adolescent, ranging from birth to 21 years of age. However, the EMA classifies pediatrics as ranging from birth to 18 years of age.

The analysts forecast the Global Preventable Vaccines market to grow at a CAGR of 10.16 percent over the period 2014-2019.

Covered in this Report
